

1. State what is meant by coherent
 - Constant phase difference between the waves with time

2. For a progressive wave, state what is meant by its period
 - Time for 1 oscillation/vibration/cycle OR time between adjacent wave fronts passing the same point

3. State the meaning of polarisation
 - oscillations are in a single direction, which is perpendicular to the direction of propagation of the wave OR oscillations are in a single plane, which contains the direction of propagation of the wave.
